

Troubleshooting Chart

This chart shows how different problems in a Production manifest themselves in different Management Portal pages. The chart also addresses how to fix the problem and what will happen once the problem is fixed.

Problem	Setting That Can Impact	Configuration Page	Event Log	Message Viewer/ Visual Trace	Jobs Page	Queues Page	External System or File System	Business Rule Log	What To Do/Outcome
BO adapter setting incorrect. External application unavailable.	Adapter timeouts (Open, Read, Failure, etc). Stay Connected for adapter. Alert on Error. Grace Period. Inactivity timeout.	Item status red after timeout and green before timeout or if timeout = -1. Jobs tab shows status as Retry and color as orange until after timeout or if timeout = -1. If timeout is not -1, then after timeout. status is Error and goes red.	Failure timeout error message after timeout. May get error message prior to timeout depending on BO.	Message to BO has status of Error after timeout and status of Delivered before timeout. Indicates error message exists.	Status is Running and Active Message column has value before timeout or if timeout = -1. If timeout is not -1, then status Dequeueing after timeout.		No data sent out of Production.		If problem fixed before timeout, processing will continue where left off. If problem fixed after timeout, can resend messages.
BS adapter setting incorrect. Client application not sending data	Adapter timeouts (Read, File access, etc). Stay Connected for adapter. Alert on Error. Grace Period. Inactivity Timeout.	Item status is red. Jobs tab shows status as OK.	Warning message and Error message.	No sessions for that BS.	Status of dequeuing (this is normal).	Not applicable.			Once fixed, processing will continue—data will be brought in as determined by Call Interval.
Pool size = 0 for inbound adapter.	Inactivity Timeout.	Item status is green. PoolSize on item is 0. Jobs tab is empty.	No messages.	No session.	No job listed for item.	Not applicable.	No data brought into Production.		Once Pool Size >0, processing will continue—data will be brought in.
Pool size = 0 for outbound adapter.	Inactivity Timeout.	Item status is green. PoolSize on item is 0. Jobs tab is empty.	No messages.	End of message to BO is gray. Message status is Queued.	No job listed for item.	Count is non-zero.	No data sent out of Production.		Once Pool Size >0, processing will continue—messages in queue will be processed.
BO not enabled.		Item is gray. Jobs tab is empty.	No messages.	End of message to BO is gray. Message status is Queued.	No job listed for item.	Count is non-zero.	No data sent out of Production.		Once BO enabled, processing will continue—messages in queue will be processed.
BS not enabled.		Item is gray. Jobs tab is empty.	No messages.	No session.	No job listed for item.	Not applicable.	No data brought into Production.		Once BS enabled, processing will continue—data will be brought in.
BP not enabled.		Item is gray. Jobs tab is empty.	No messages.	End of message to BO is gray. Message status is Queued.	No job listed for item.	Count is non-zero.	No data sent out of Production.		Once BP enabled, processing will continue—messages in queue will be processed.
Inactivity timeout.		Item status is yellow. Jobs tab shows status as Inactive and is yellow.	No messages.						Once message arrives to component, it will be handled.
Update Production button remains showing.		Update Production shows. Initially all items go grey then back to green.	Depending on reason for Update may get Assert messages about ConfigItem.	If for BS or BP, no session created. If for BO, no message in trace after BO.	Depending on reason for Update Button may have no job listed for item.	Depending on reason for Update Button may have no queue for item.	No data sent out of Production. If for BS, no data sent into Production either.		Click Update Production button.

HL7 and BPL Problems									
Problem	Setting That Can Impact	Configuration Page	Event Log	Message Viewer/ Visual Trace	Jobs Page	Queues Page	External System or File System	Business Rule Log	What To Do/Outcome
Message does not match a Routing Rule.	Constraints and conditions for rule.	Empty Schema Category for BS could lead to no rule matching.	No messages.	No message comes out of BP.			No data sent out of Production.	Entry with Reason is blank.	Once problem fixed so messages will match a rule, can resend messages to appropriate Message Router.
Target of BS doesn't exist.	Target Config Names for BS.	No connection out of BS when compute connections.	Error that BP is not registered to run, with a source of the BS.	No session.			No data sent out of Production.		Change BS to use correct name in Target Config Names.
No Schema Category in BS and is needed.	Schema Category for BS.	Schema Category empty for BS.	No message.	No message comes out of BP.			No data sent out of Production.	Entry with Reason is blank, if schema needed for Bus Rule	Add schema to Schema Category for BS.
Message fails validation.	Validation property for BP. Alert on Bad Message for BP.		Error about validation.	No message comes out of BP. Indicates error message exists.			No data sent out of Production.	Entry with Reason is blank.	Determine if Validation property setting of BP should be removed or changed. Determine if Alert on Bad Error processing should be configured. If not, local procedures determine what to do next. For example, sending system may need to be changed.
Routing Rule name mismatch in BP.	Business Rule Name setting for BP.	Item is red. No lines connecting Router to another component when compute connections.	Error message.	No message comes out of BP. Indicates error message exists.			No data sent out of Production.	Red entry with Error Message entry about Routing Rule not found.	Change Business Rule Name setting for BP.
Rule refers to component that doesn't exist.	Target for rule.	Item is red.	Error about component not registered to run.	No message comes out of BP. Indicates error message exists.			No data sent out of Production.	Valid entry shows the incorrect target name.	Change Source for rule, or add component to Production.
Required Data Transformation for rule not specified.	Data Transformation for rule.		No message.	Comparison shows message in and out of BP are the same.			Untransformed message sent out of Production.	Valid entry shows went to target without going to a Data Transformation.	Add Data Transformation to rule.
Business Rule referred to in BPL Rule activity does not exist.	Rule property for Rule Activity in BP.		No message.	Response message from BP may have wrong value or may not exist.			Depends on the BP's error handling – no or incorrect data may be sent out of Production.	Red entry with Error Message entry about Routing Rule not found.	Change Rule property for Rule Activity in BP.
